

**Product:** Sharp MAX PLUS

# Molding New Ideas

Plastic injection molder increases productivity by 23% while lowering labor costs by 40%

## **ADVANTAGES:**

**40% DECREASE IN LABOR COSTS**

**23% INCREASE IN PRODUCTIVITY**

# This manufacturer of complex plastic parts for health care, consumer and electronics markets used a hand-counting and hand-loading system.

The hand-loading system was inefficient and time-intensive, with inherently higher labor costs. It also increased the potential for errors.

The Sharp Max Plus® system, with integrated thermal imprinter and automatic weigh counter, elevated the process from semi-automatic to fully automated.

In the first step – opening the bag – a three-point verification system monitors success. First the machine uses a puff of air to open the bag. It senses whether the bag has opened; if not, it inserts a funnel to mechanically open the bag on the second try. Again it checks whether a bag is present and open. If not, it presents a new bag and starts again. The system can be set to the desired number of tries before human intervention is asked for.

The Sharp Max Plus also ensures a reliable count while filling bags. It can either weigh-count or optically count the injection-molded pieces being dropped into the bag. In the case of this customer, a reliable weight count was crucial. Sharp's system is the only one in the marketplace that can achieve the weight-count level of precision.

Replacing the former process of hand loading, the Sharp Max Plus uses robotic arms to drop the mold(s) into the bag.

The thermal imprinting capability of the Sharp Max Plus allows direct printing onto the bag of all verification codes and barcodes necessary for traceability. An onboard PC allows the operator to pull up various jobs, create labels, and keep a history of events within each account for maintenance, record-keeping, and tracing human or machine error. and downtime is decreased.

*“The custom design we created is an extremely sophisticated bagger. It has become standard in the marketplace.”*

For this market, the custom design we created is an extremely sophisticated bagger. It has become standard in the marketplace and is available to our other customers as well.

Thanks to our use of many standard parts and off-the-shelf components, this customer easily added many options to fit this situation.

We serve the injection molding market with several types of bags:

- » Sharp Packaging High Density white opaque-to-clear
- » Clear co-extruded film
- » Gamma film

## Outcome

By listening closely to this customer's needs, we created a customized yet highly standardized bagger. Productivity at this manufacturer increased by 23%, and labor decreased by 40%.

The project earned CE approval for the Sharp Max Plus, enabling us to work overseas with this company as well. CE approval assures compliance with essential requirements of applicable EC (European Conformity) directives. This allows our injection-molding customers to sell their products within the European Economic Area.
